Постановка задачи

Вариант 1.

1 вариант) Пользователь вводит команды вида: «число число число<endline>». Далее эти числа передаются от родительского процесса в дочерний. Дочерний процесс считает их сумму и выводит её в файл. Числа имеют тип int. Количество чисел может быть произвольным.

Общий метод и алгоритм решения

Использованные системные вызовы:

- OpenFileMapping - открывает уже созданный объект разделяемой памяти, возвращает дескриптор открытого объекта памяти, если ошибка - NULL
- MapViewOfFile - отображает объекты разделяемой памяти в адресное пространство текущего процесса
- UnmapViewOfFile - отменяет отображение разделяемой памяти
- CloseHandle - закрывает дескриптор объекта памяти
- OpenSemaphore - открывает существующий семафор
- WaitForSingleObject - блокирует выполнение процесса до изменения состояния
- ReleaseSemaphore - увеличивает счетчик семафора, сигнализируя, что ресурс доступен
- Fopen - открывает файл для записи
- Fflush(file) - принудительно записывает буферизированные данные в файл
- Fclose - закрывает файл
- Strcpy - копирует строку из разделяемой памяти в локальную переменную
- Strncmp - сравнивает строки
- Strtok - разбирает строку на части (разделенные пробелами и символами новой строки)
- CreateFileMapping - создает объект разделяемой памяти
- CreateSemaphore - создает семафоры для управления доступом к памяти
- CreateProcess - создает новый процесс
- Fgets - считывает ввод пользователя
- Strcspn - находит индекс «\n» и заменяет его на «\0»

В данной программе мы создаем разделяемую память с именем “Local\\MySharedMemory”, которая позволяет передавать данные между процессами, создаем два семафора: hSemEmpty - указывает, что память пуста и можно записывать данные, hSemFull - указывает, что память заполнена и можно

читать данные. Далее запускаем дочерний процесс, запрашиваем имя выходного файла у пользователя и записываем его в разделяемую память. Происходит передача имени файла дочернему процессу: родитель ждет, пока память освободится, записывает имя файла в разделяемую память, устанавливает флаг `data_ready = 1`, разрешает чтение данных дочернему процессу. Дочерний процесс подключается к разделяемой памяти и семафорам с помощью `OpenFileMapping()` и `OpenSemaphore()`, ждет, пока родитель запишет имя файла, читает имя файла и открывает его для записи, сообщает родителю, что данные прочитаны. Дочерний процесс вычисляет сумму чисел и записывает результат в файл и в разделяемую память. Родительский процесс ждет, пока дочерний процесс запишет результат, читает сумму из разделяемой памяти и выводит на экран, освобождает память для новой записи. Родительский процесс повторяет эти действия, пока пользователь не введет «exit». по завершению программы родительский процесс ждет завершения дочернего, закрывает дескрипторы разделяемой памяти и семафора и завершается. Дочерний же процесс закрывает файл, освобождает разделяемую память и семафоры и завершается.

Вывод

Программа демонстрирует взаимодействие между родительским и дочерним процессами с использованием разделяемой памяти и семафоров для синхронизации. Родительский процесс считывает строки от пользователя и передает их родительскому процессу через разделяемую память. Дочерний процесс обрабатывает строки, вычисляет сумму чисел и записывает ее в файл, а также выводит соответствующее сообщение на экран.
