Постановка задачи

Вариант 7.

Списки свободных блоков (наиболее подходящее) и блок и по 2^n

Общий метод и алгоритм решения

Использованные системные вызовы:

- VirtualAlloc() - выделение памяти в адресном пространстве процесса
- VirtualFree() - освобождает выделенную память
- LoadLibraryA() - загрузка динамической библиотеки
- GetProcAddress() - получение адреса функции из библиотеки
- FreeLibrary() - выгрузка динамической библиотеки после использования (library.dll)

Этапы работы программы:

1. Загрузка динамической библиотеки (library.dll):

Если библиотеки не найдена (hModule == NULL), программа сообщает, что будет использовать стандартный системный аллокатор

2. Получение адресов функций из library.dll:

Allocator_create_ptr - создает аллокатор, allocator_destroy_ptr - уничтожает аллокатор, allocator_alloc_ptr - выделяет память, allocator_free_ptr - освобождает память

3. Создание пользовательского аллокатора:

Выделяется 1024 байта с памяти с помощью VirtualAlloc(), вызов allocator_create_ptr() создает объект аллокатора, который будет управлять выделенной памятью

4. Выделение памяти через аллокатор:

Программа запрашивает 128 байт памяти у аллокатора и выводит адрес выделенной памяти

5. Освобождение памяти:

Освобождает ранее выделенный блок памяти

6. Уничтожение аллокатора

7. Выгрузка library.dll

Код программы

Вывод

В рамках лабораторной работы была разработана программа, демонстрирующая работу с динамическими библиотеками и управлением памятью с использованием пользовательского аллокатора. В процессе работы были изучены и реализованы следующие механизмы: динамическая загрузка библиотеки, создание и управление пользовательским аллокатором,

выделение и освобождение памяти через пользовательские аллокаторы, освобождение ресурсов, таких как динамически загруженная библиотека.
